LEMB CAD Return **+4.24%**

1-Year LEMB CAD Return Attribution

1-Year EM Local Bond Return vs Duration-Matched Canadian Federal Bonds

LEMB CAD Return Decomposition

Period	LEMB Total Return (CAD)	Local Rates & Carry Return	Matched EM FX Return vs CAD	Local x FX Interaction
YTD	+2.92%	+2.47%	+0.44%	+0.01%
1Y	+4.24%	+3.85%	+0.38%	+0.01%
3Y	+27.69%	+23.54%	+3.36%	+0.79%

EM Local Bonds vs Duration-Matched Canada — Relative Performance

Period	EM Local Rates & Carry Return	Duration-Matched Canadian Federal Bond Return	EM Local vs Canada Excess Return
YTD	+2.47%	+0.13%	+2.33%
1Y	+3.85%	-0.72%	+4.57%
3Y	+23.54%	+13.11%	+10.44%

Current Structural Signals

EM Local / Synthetic Canada

3Y Z +1.97 | Percentile 97.7% | Positioning High

Momentum: Strong Positive | **Acceleration: Strongly Decelerating**

LEMB-Matched EM FX vs CAD

3Y Z +0.84 | Percentile 73.4% | Positioning Neutral

Momentum: Flat / Noisy | **Acceleration: Accelerating**

Signal interpretation: EM Local / Synthetic Canada rising = EM local rates & carry outperforming duration-matched Canada; LEMB-Matched EM FX vs CAD rising = LEMB-weighted EM currencies strengthening versus CAD.

Matched FX largest weights: CNY 15.3% | INR 8.9% | MXN 5.2% | MYR 4.9% | IDR 4.5% | PLN 4.4%

Methodology: LEMB CAD = adjusted LEMB USD x USD/CAD. Local Rates & Carry = LEMB CAD / matched FX basket. Canada = 37.0% ZFS + 63.0% ZFM, targeting 5.20y duration. Current LEMB currency weights are applied historically.

Portfolio Factor Positioning

High Dividend vs World

XDG.U / URTH

Positioning	Momentum	Acceleration
Neutral	**Flat / Noisy**	**Decelerating**

Purpose

Compares the MSCI World High Dividend Yield factor with the broad MSCI World market.

Comment - Flat Trend, Weakening

The ratio is near its recent historical norm, at the 45.5th percentile (z-score -0.31). 63-day trend momentum is negative at -1.6% annualized (slope t-stat -0.44). Momentum is decelerating: -0.2 percentage points versus 21 trading days ago (3Y acceleration z-score +0.01). A rising ratio favors global high-dividend leadership; a falling ratio favors the broader world market.

Risk Appetite / Speculation

Small-Cap Speculation

IWC / IJR

Purpose	Positioning	Momentum	Acceleration
Measures microcap leadership relative to profitable small caps. Higher readings indicate stronger speculative risk appetite.	Neutral	Strong Negative	Strongly Decelerating

Comment - Negative Momentum, Worsening

The ratio is near its recent historical norm, at the 67.9th percentile (z-score +0.91). 63-day trend momentum is negative at -13.8% annualized (slope t-stat -4.42). Momentum is decelerating: -26.2 percentage points versus 21 trading days ago (3Y acceleration z-score -1.89). A rising ratio is consistent with stronger small-cap speculative appetite.

EM Local Bond / Currency

EM Local Bond Index vs Canada Federal Bond Index

EM Local / Synthetic Canada

Purpose

Compares a LEMB-derived EM local government bond index (local rates & carry, with FX stripped out) against a duration-matched synthetic Canadian federal government bond index. A rising ratio indicates EM local sovereign bonds are outperforming comparable-duration Canadian federal bonds.

Positioning	Momentum	Acceleration
High	**Strong Positive**	**Strongly Decelerating**

Comment - Positive Momentum, Decelerating

The ratio is historically elevated at the 97.7th percentile of its 3-year range (z-score +1.97). 63-day trend momentum is positive at +2.9% annualized (slope t-stat +3.98). Momentum is decelerating: -5.9 percentage points versus 21 trading days ago (3Y acceleration z-score -1.08). A rising ratio indicates the EM local rates & carry proxy is outperforming the duration-matched Canadian federal benchmark.

EM Local Bond / Currency

LEMB-Matched EM FX vs CAD

LEMB-Matched EM FX / CAD

Purpose

Measures the CAD value of a currency basket matched to LEMB's latest market-currency weights. A rising index indicates the LEMB-weighted EM currency basket is strengthening versus CAD.

Positioning	Momentum	Acceleration
Neutral	Flat / Noisy	Accelerating

Comment - Flat Trend, Improving

The ratio is near its recent historical norm, at the 73.4th percentile (z-score +0.84). 63-day trend momentum is negative at -0.4% annualized (slope t-stat -0.41). Momentum is accelerating: +2.5 percentage points versus 21 trading days ago (3Y acceleration z-score +0.35). A rising index indicates LEMB-weighted EM currencies are appreciating versus CAD; a falling index indicates CAD strength.

Calculation Conventions & Methodology

Summary of data treatment, statistical measures and classification rules used throughout the report

1. Market Data

Daily market data are downloaded from Yahoo Finance using yfinance. The script requests Close with auto_adjust=True, so the series are adjusted for corporate actions such as splits and distributions. They are adjusted-price / total-return-like series rather than raw closes.

2. Relative-Performance Ratios

For most indicators: Relative Ratio = Numerator Adjusted Price / Denominator Adjusted Price. A rising ratio means the numerator is outperforming the denominator; a falling ratio means it is underperforming.

3. Resources vs World

IXC and MXI are converted to daily percentage returns. A 50% IXC + 50% MXI daily-rebalanced return is compounded into a synthetic resource index. URTH is normalized over the same dates. Resources vs World = Synthetic Resource Index / Normalized URTH.

4. Historical Averages

1Y, 3Y, 5Y and 10Y averages are arithmetic means of available daily ratio observations within each trailing calendar-year window. If less than 10 years of history exists, '10Y / available avg' uses the observations actually available.

5. Positioning Statistics

Deviation (%) = (Current Ratio / Historical Average - 1) x 100. The 3Y z-score measures the current ratio's distance from its trailing 3-year mean in standard deviations. The 3Y percentile is the share of trailing 3-year daily observations less than or equal to the current ratio.

6. Momentum

Momentum is estimated from a 63-trading-day ordinary least-squares regression of log(Relative Ratio) on time. The fitted daily slope is multiplied by 252 and by 100 to express the trend as an approximate annualized relative-performance rate.

7. Momentum Strength

The regression slope t-statistic distinguishes persistent trend from noise. Strong Positive requires a positive slope with t-stat >= +2; Positive requires t-stat >= +1. Strong Negative requires a negative slope with t-stat <= -2; Negative requires t-stat <= -1. Other readings are Flat / Noisy.

8. Momentum Acceleration

Acceleration = Current 63D Annualized Momentum - 63D Annualized Momentum 21 trading days earlier. This finite difference approximates the second derivative of the log relative-performance path: positive values mean the trend is becoming more positive; negative values mean the trend is becoming more negative.

9. Acceleration Strength

Acceleration is standardized against its own trailing 3-year history. A positive acceleration with z-score >= +1 is Strongly Accelerating; any other positive reading is Accelerating. A negative acceleration with z-score <= -1 is Strongly Decelerating; any other negative reading is Decelerating.

10. Interpretation

Positioning describes where the ratio is historically; Momentum describes the current direction and persistence of relative performance; Acceleration describes whether that momentum is strengthening or weakening. The EM local-bond decomposition uses LEMB's latest reported market-currency weights to build a custom CAD currency basket from Yahoo FX rates. The Canadian comparison is a synthetic ZFS/ZFM federal bond benchmark calibrated to LEMB's target duration. The resulting EM Local / Synthetic Canada relative index and LEMB-matched EM FX vs CAD index are then passed through the same positioning, momentum and acceleration framework.

Positioning	Extremely High: Z >= +2 | High: +1 to +2 | Neutral: -1 to +1 | Low: -2 to -1 | Extremely Low: Z <= -2
Trend windows	Momentum = 63 trading days (~3 months) | Acceleration lookback = 21 trading days (~1 month) | Annualization = 252 trading days
